Quick Recap

- The
 - ▶ The economic condition for single parent family is usually more fragile than traditional nuclear family
 - ▶ Besides, single parent might not give enough mental support to children
- We aim to estimate the negative impact on children's education attainment

Dataset

Taiwan Education Panel Survey and Beyond, SRDA

- A panel data tracking down two different groups of children across almost 20 years
 - ▶ group 1: born in 1984-1985
 - ▶ group 2: born in 1988-1989
- Survey on the children, their parent and teachers, even after they enter labor market
- So we have comprehensive information about the children's behavior, relationship and academic performance

Sample

- Treatment variable (D_i): single parent family
- Outcome variable (Y_i): university degree, public university and working years
- In order to find possible confounders, we consider the covariates from these survey data for each group:
 - ▶ student
 - ▶ classroom teacher
 - ▶ Chinese, English, Math teacher
 - ▶ parents
- We pick an abundance of covariates to conduct PDS

Empirical Specification

Post-Double Selection

- With PDS, we can identify the confounders in roughly 110 selected covariates and identify the causal relationship

$$Y_i = \beta_0 + \beta_1 D_i + \bigcup_{j \in A \cup B} \pi_j W_i^j + \epsilon_i$$

where A, B are the Lasso-selected covariates at step 1 & 2 in PDS.

- In later analysis, we try to compare if there is any difference of effect between groups
